Research Summary

Thermal spray wires are specialized materials used in thermal spraying processes to create protective or functional coatings on surfaces. These wires are typically made of metals, alloys, or other materials with desirable properties for specific applications. In the thermal spray process, the wire is fed into a thermal spray gun, where it is heated to a molten or semi-molten state. The material is then propelled onto a substrate, forming a coating upon solidification. Thermal spray wires are chosen based on factors such as coating thickness, desired properties of the final coating, and the environmental conditions the coating will face. Common applications include corrosion protection, wear resistance, and restoration of surfaces in industries such as aerospace, automotive, and manufacturing. The use of thermal spray wires provides a versatile and effective solution for improving the performance and longevity of various components and structures.

The major global manufacturers of Thermal Spray Wires include Oerlikon Metco, Kanthal, Metallisation, Polymet Corporation, Tankii, Parat Tech, Flame Spray
