Research Summary

Thermistors are temperature-sensitive resistors that exhibit a significant change in electrical resistance with variations in temperature. These electronic devices are designed to provide precise temperature measurement and control in various applications. Thermistors are typically made of ceramic materials with a high temperature coefficient of resistance, meaning their resistance changes significantly with temperature fluctuations. The two main types of thermistors are positive temperature coefficient (PTC) and negative temperature coefficient (NTC), with PTC thermistors exhibiting an increase in resistance with temperature rise, and NTC thermistors showing a decrease. Thermistors are widely used in industries such as electronics, automotive, and healthcare for applications like temperature sensing in electronic circuits, temperature compensation in sensors, and control in heating systems. Their sensitivity to temperature changes makes thermistors valuable components in achieving accurate and reliable temperature measurements in a range of devices and systems.

The major global manufacturers of Thermistors include Thinking Electronic, TE

Connectivity, Polytronics Technology Corporation, TDK Corporation, Shibaura, Shiheng Electronic, Semitec Corporation, Vishay, Amphenol Corporation, Mitsubishi Materials Corporation, Murata, WAYON, KYOCERA AVX Components Corporation, Bourns, Panasonic, Littelfuse, etc. The global players competition landscape in this report is divided into three tiers.
