Research Summary

A thermogravimetric analyzer (TGA) is a laboratory instrument used for analyzing the weight changes of a sample as a function of temperature or time in a controlled atmosphere. The TGA operates by subjecting the sample to a programmed temperature ramp while continuously measuring its weight. The weight changes observed during the analysis can provide valuable information about various properties of the sample, such as composition, thermal stability, and decomposition kinetics. TGA is widely used in materials science, chemistry, and quality control to characterize a range of materials, including polymers, composites, pharmaceuticals, and catalysts. The data obtained from TGA experiments aid researchers and scientists in understanding the thermal behavior and stability of materials under different conditions, contributing to the development and optimization of materials for specific applications.

The major global manufacturers of Thermogravimetric Analyzer include Waters, Mettler-Toledo, Shimadzu, PerkinElmer, Hitachi, Netzsch, Rigaku, Linseis, Navas Instruments, setaram, Instrument Specialists, Shanghai Hesontest, Beijing Henven, etc. The global
