Research Summary

A Through Glass Via (TGV) wafer is a specialized substrate used in semiconductor and microelectromechanical systems (MEMS) manufacturing that incorporates Through Glass Via technology. TGV wafers feature precise holes or vias that traverse the entire thickness of the glass substrate, allowing for vertical interconnection of multiple layers within semiconductor devices. These vias serve as electrical conduits, enabling the integration of complex three-dimensional structures. TGV wafers are employed in applications where miniaturization, high density, and enhanced performance are essential, such as in sensors, microprocessors, and other advanced electronic components. The use of glass as a substrate in TGV wafers offers benefits such as optical transparency, high thermal stability, and chemical resistance, making them suitable for a range of cutting-edge electronic and MEMS devices.
