Research Summary

A Through Glass Vias (TGV) substrate is a specialized material used in semiconductor and microelectromechanical systems (MEMS) manufacturing that incorporates Through Glass Via technology. TGV substrates are characterized by the presence of carefully engineered holes or vias that traverse the entire thickness of the glass material. These vias enable vertical interconnection between different layers of circuits within the substrate, facilitating three-dimensional integration of electronic components. Through Glass Vias substrates are employed in applications where miniaturization, high integration density, and improved performance are critical, such as in sensors, actuators, and other advanced electronic devices. The use of glass as a substrate in TGV technology provides advantages such as optical transparency, high thermal stability, and chemical resistance, making it well-suited for various cutting-edge electronic and MEMS applications.
