Research Summary

Through Silicon Via (TSV) is a technology used in semiconductor manufacturing to create vertical interconnections that pass through the silicon substrate, enabling the stacking of multiple layers of integrated circuits. TSVs are essentially conductive vias that provide pathways for electrical signals between different layers of silicon. This technology addresses the limitations of traditional two-dimensional scaling and offers advantages such as reduced signal delays, improved performance, and enhanced integration density in three-dimensional integrated circuits (3D ICs). TSVs play a crucial role in advanced semiconductor packaging, enabling the creation of compact and efficient devices with improved electrical connectivity. This technology finds applications in various electronic devices, including microprocessors, memory chips, and image sensors, contributing to the development of more powerful and compact semiconductor components.

The major global suppliers of Through Silicon Via (TSV) include ASE Group (SPIL), Amkor Technology, TSMC, Intel, GlobalFoundries, JCET, Samsung, Huatian, etc. The
