### Research Summary

Through-wall radar refers to a type of radar technology designed to detect and track objects or people located behind walls, barriers, or other obstacles. This technology utilizes electromagnetic waves, typically in the microwave or millimeter-wave frequency range, to penetrate walls and reflect off objects on the other side. Through advanced signal processing techniques, the radar system can analyze the reflected signals to generate images or information about the presence, location, and movement of objects or individuals within an enclosed space. Through-wall radar systems have applications in various fields, including military and law enforcement for surveillance, search and rescue operations, and monitoring structural integrity in buildings. They provide a non-intrusive means of obtaining situational awareness in scenarios where direct visual observation is challenging or not feasible.
