### Research Summary

Thyroid function tests are a group of blood tests that assess the functionality of the thyroid gland, a crucial endocrine organ that regulates metabolism and various physiological processes. These tests typically include measurements of thyroid hormones such as thyroxine (T4) and triiodothyronine (T3), as well as thyroid-stimulating hormone (TSH) produced by the pituitary gland. TSH levels indicate the feedback mechanism controlling thyroid hormone production. Abnormal results in thyroid function tests can help diagnose conditions like hypothyroidism (underactive thyroid) or hyperthyroidism (overactive thyroid). Additionally, tests for thyroid antibodies may be conducted to identify autoimmune thyroid disorders such as Hashimoto's thyroiditis or Graves' disease. Thyroid function tests play a crucial role in evaluating thyroid health, guiding treatment decisions, and monitoring patients with thyroid-related disorders.
