Research Summary

Time-Sensitive Networking (TSN) is a set of standards within the IEEE 802.1 working group that aims to enhance and standardize the capabilities of Ethernet networks to support time-critical applications. TSN addresses the need for precise timing and low-latency communication in industrial automation, automotive, audio/video streaming, and other real-time applications. By incorporating time synchronization mechanisms, TSN ensures that devices on the network share a common understanding of time, enabling synchronized and deterministic communication. TSN introduces features such as time-aware shaping, scheduled traffic, and frame preemption to prioritize and manage network traffic effectively. This set of standards plays a crucial role in enabling the convergence of various applications on a single Ethernet network while meeting the stringent timing requirements of diverse industries. TSN enhances the reliability and predictability of communication in time-sensitive applications, contributing to the development of more robust and interconnected systems.

The major global suppliers of Time-Sensitive Networking (TSN) include Belden, Cisco,
