Research Summary

Titanium dental implants are medical devices used in dentistry to replace missing teeth by providing a stable foundation for artificial tooth restorations. These implants are typically made from commercially pure titanium or titanium alloys due to their biocompatibility, corrosion resistance, and strength. The implant consists of a small screw-like post that is surgically inserted into the jawbone, acting as an artificial tooth root. Over time, the surrounding bone fuses with the titanium surface through a process called osseointegration, creating a secure and durable connection. Once osseointegration is complete, a dental crown, bridge, or denture can be attached to the implant to restore the appearance and functionality of the missing tooth or teeth. Titanium dental implants have become a standard and reliable solution in modern dentistry, offering long-term stability and natural-looking results for patients seeking tooth replacement options.

The major global manufacturers of Titanium Dental Implants include Straumann, Danaher, Dentsply, Zimmer Biomet, Osstem, Henry Schein, GC, Kyocera Medical,
