Research Summary

A tonometer is a medical device used to measure the intraocular pressure (IOP) within the eye, which is an important factor in assessing eye health. Elevated intraocular pressure can be associated with conditions like glaucoma, a group of eye diseases that can lead to optic nerve damage and vision loss. There are various types of tonometers, with the most common being the applanation tonometer and the non-contact tonometer. The applanation tonometer measures IOP by flattening a small area of the cornea, while the non-contact tonometer uses a puff of air to estimate intraocular pressure. Accurate measurement of IOP is crucial in diagnosing and managing conditions like glaucoma, as elevated pressure may indicate increased risk. Regular monitoring with a tonometer is often part of routine eye examinations to ensure early detection and intervention for eye conditions.
