Research Summary

Total Fluid Management (TFM) is a medical approach aimed at optimizing and regulating a patient's fluid balance during surgical procedures or critical care situations. The goal of TFM is to carefully monitor and control the intake and output of fluids, including intravenous fluids, blood products, and other medications, to maintain the patient's hydration, blood pressure, and overall physiological stability. TFM involves a meticulous assessment of the patient's fluid needs based on factors such as age, weight, medical condition, and the nature of the surgical or medical intervention. By closely managing fluid administration, healthcare professionals strive to prevent complications associated with either fluid overload or depletion, such as edema, organ dysfunction, or inadequate tissue perfusion. This comprehensive approach to fluid management is crucial in optimizing patient outcomes, particularly in complex surgical procedures or critical care scenarios where maintaining the right balance of fluids is essential for the patient's well-being.
