Research Summary

Trading of carbon credits, also known as carbon emissions trading, is a market-based mechanism aimed at reducing greenhouse gas emissions and combating climate change. Carbon credits represent a unit of emissions reductions or removals equivalent to one ton of carbon dioxide (CO₂) or its equivalent. In a carbon trading system, governments or regulatory bodies set a cap on total emissions and allocate or auction a limited number of carbon credits to companies or entities. Those entities that emit less than their allocated limit can sell their surplus credits to others that exceed their emission limits. This system creates financial incentives for companies to invest in emission reduction projects, such as renewable energy or reforestation, and provides a mechanism for businesses to offset their unavoidable emissions by purchasing credits from projects that reduce emissions elsewhere. Carbon trading aims to incentivize emissions reductions cost-effectively, spur innovation in low-carbon technologies, and promote sustainable development.
