### Research Summary

Transcatheter Heart Valve Replacement and Repair is a category of minimally invasive procedures aimed at treating heart valve disorders without the need for traditional open-heart surgery. This approach involves the use of a catheter, a thin tube, which is typically inserted through a blood vessel, often starting in the groin or leg, and guided to the heart. Once in position, various techniques can be employed. Transcatheter Aortic Valve Replacement (TAVR) specifically addresses aortic valve issues, while other procedures, like MitraClip, focus on repairing the mitral valve. TAVR replaces a narrowed aortic valve with a prosthetic one, improving blood flow. MitraClip, on the other hand, involves clipping the leaflets of the mitral valve to address issues like regurgitation. These procedures offer significant advantages, including shorter recovery times, reduced risk of complications, and the possibility of treating patients who may be considered high risk for conventional surgery. The selection of a specific transcatheter approach depends on the type and location of the valve disorder, and decisions are

made in consultation with a cardiac care team.
