Research Summary

A transdermal drug delivery system is a pharmaceutical formulation designed to deliver drugs through the skin into the bloodstream for systemic effects. This non-invasive method involves the application of a patch or gel containing the drug directly onto the skin, allowing the medication to be absorbed through the skin layers and into the bloodstream. Transdermal drug delivery offers several advantages, including sustained and controlled release of the medication, reduced side effects, and improved patient compliance compared to traditional oral or injectable routes. This system is commonly used for medications such as pain relievers, hormonal treatments, and nicotine replacement therapy. The design of transdermal patches considers factors like skin permeability, drug formulation, and adhesive properties to ensure effective and safe drug delivery over an extended period.

The major global manufacturers of Transdermal Drug Delivery System include Hisamitsu, Mylan, GSK, Novartis, Teve (Actavis), Johnson & Johnson, Lohmann,
