### Research Summary

Transesophageal echocardiography (TEE) is a medical imaging technique that involves the insertion of a specialized ultrasound probe into the esophagus to obtain detailed images of the heart and its surrounding structures. This procedure provides a closer and clearer view of the heart than traditional transthoracic echocardiography (TTE) because the esophagus is located closer to the heart, allowing for better visualization. TEE is commonly used to assess cardiac function, valve disorders, blood flow patterns, and the presence of blood clots or other abnormalities within the heart. It is often employed during surgical procedures, such as cardiac surgeries, to guide interventions and monitor real-time changes in cardiac anatomy and function. TEE is considered a valuable tool in cardiology, offering high-resolution images that aid in the accurate diagnosis and management of various cardiac conditions.

The major global manufacturers of Transesophageal Echocardiography (TEE) include Philips, Siemens Healthineers, GE Healthcare, Canon, Hitachi, Mindray, Samsung
