### Research Summary

A transformer is an electrical device that transfers electrical energy between two or more circuits through electromagnetic induction. It consists of two coils of wire, known as the primary and secondary windings, wrapped around a common magnetic core. When an alternating current (AC) flows through the primary winding, it generates a changing magnetic field in the core, which, in turn, induces an electromotive force in the secondary winding. This process allows the transformer to step up or step down the voltage level between the input and output circuits while preserving the power. Transformers are essential components in electrical power distribution systems, serving to transmit electricity efficiently over long distances and to match voltage levels between power sources and end-use devices. They come in various types and sizes, each designed for specific applications, such as power transmission, voltage regulation, and impedance matching in electronic devices.

The major global manufacturers of Transformer include Hitachi, HiReli, GE, Eaton, Festo, SIEMENS, Hyundai, Schneider Electric, Alstom, CAHORS, Hyosung Heavy

Industries, Daelim-electric, Mitsubishi Electric, Electromec Engineering Enterprises, Sumesh Engineer, Toshiba (Changzhou), China XD Group, etc. The global players competition landscape in this report is divided into three tiers.
