Research Summary

Transparent Conducting Oxide (TCO) glass is a type of glass that combines optical transparency with electrical conductivity. This specialized glass is coated with a thin layer of transparent conducting oxide material, typically indium tin oxide (ITO) or fluorine-doped tin oxide (FTO). The transparency of TCO glass allows light to pass through, while the conductive coating enables the transmission of electrical currents. TCO glass finds applications in various technologies, including touchscreens, solar cells, and flat-panel displays. In touchscreens, TCO glass enables users to interact with electronic devices by detecting touch or gestures. In solar cells, TCO glass serves as a transparent electrode, facilitating the efficient conversion of sunlight into electricity. The unique combination of optical transparency and electrical conductivity in TCO glass makes it a crucial component in the development of advanced electronic and optoelectronic devices.
