Research Summary

In photography, a tripod is a three-legged support system used to stabilize and elevate a camera or other imaging equipment. The primary purpose of a tripod is to prevent camera shake during exposure, especially in situations where longer exposure times are required. Tripods provide a stable platform, reducing the risk of blurred images caused by hand movements. They come in various sizes, materials, and designs, offering flexibility for different photography needs. Tripods typically consist of three extendable legs with adjustable height, allowing photographers to position their cameras at various angles and elevations. Some tripods also feature a central column for additional height adjustment.
