Research Summary

The inside-out tubular membrane module is a configuration used in membrane filtration systems for various separation processes. In this design, tubular membranes consist of a hollow fiber structure where the filtration occurs from the inside of the tube to the outside. The feed solution containing particles or solutes is introduced into the lumen (inner space) of the tubular membranes, and the permeate, which is the purified or separated liquid, passes through the membrane walls to the outside. This design is commonly employed in applications such as microfiltration, ultrafiltration, and nanofiltration, where the tubular geometry allows for efficient separation and concentration of substances in liquids. The inside-out tubular membrane module is used in industries such as water treatment, pharmaceuticals, and biotechnology, offering advantages like high surface area, scalability, and ease of maintenance in various filtration processes.
