Research Summary

A tunnel furnace is a type of industrial furnace designed for continuous processing of materials at high temperatures in a controlled environment. It consists of a long, enclosed tunnel-like structure through which materials or products move on a conveyor belt or similar system. The furnace is equipped with heating elements, often electric resistance or gas burners, strategically positioned along the tunnel to provide uniform and consistent heat. Tunnel furnaces are used for various heat treatment processes such as annealing, hardening, tempering, or sintering of materials like metals, ceramics, or glass. The continuous nature of the process in a tunnel furnace allows for efficient and consistent heat treatment of large quantities of materials, making it suitable for mass production in industries like metalworking, automotive, and electronics manufacturing. The design of tunnel furnaces can vary based on the specific requirements of the heat treatment process and the type of materials being processed.

The major global manufacturers of Tunnel Furnace include Noritake, SAT THERMIQUE, Keka Group, ONEJOON GmbH (M&A of Eisenmann), NGK,
