### Research Summary

Tunneled catheters are medical devices designed for long-term access to a patient's vascular system, often used for hemodialysis, chemotherapy, or the administration of medications. These catheters are inserted into a large vein, typically in the chest or neck, and then "tunneled" under the skin to exit at a different location, usually near the chest. The tunneling process helps secure the catheter in place and reduces the risk of infection by keeping the catheter away from the skin's surface. Tunneled catheters are typically made of durable materials, such as silicone or polyurethane, and feature multiple lumens (tubes) to allow for different treatments or medications to be administered simultaneously. These devices are designed for long-term use, providing reliable access for weeks to months, and are commonly used in patients requiring frequent or continuous medical treatments.

The major global manufacturers of Tunneled Catheters include Teleflex, B.Braun, Merit Medical Systems, Mozarc Medical(Medtronic), Becton Dickinson(BD), Branden Medical, Vygon Group, Baihe Medical, etc. The global players competition landscape in this
