### Research Summary

A turbine governor is a control system in a power generation plant that regulates the speed and output of a turbine to maintain a stable and consistent electrical frequency on the power grid. Turbine governors are crucial components in hydroelectric, thermal, and gas turbine power plants. They operate by adjusting the flow of fuel or water to the turbine to match the electrical load demand. As the electrical load on the grid changes, the governor senses variations in speed and adjusts the turbine's power input accordingly. The goal is to ensure that the turbine operates at a constant speed and responds promptly to changes in demand, preventing fluctuations in the electrical frequency. Turbine governors contribute to the overall stability of the power grid by helping to balance the supply and demand of electricity in real-time, ensuring a reliable and consistent power supply to consumers.

The major global manufacturers of Turbine Governor include GE, Woodward, ABB, Voith GmbH, Andritz, CCER, TRIED, Mitsubishi Electric Corporation, etc. The global players competition landscape in this report is divided into three tiers. The first tier
