### Research Summary

A TV transmitter is a critical component in the broadcasting chain that sends audio and video signals from a television station to viewers' homes. It converts the electronic signals produced by cameras, microphones, and other sources into radio frequency signals suitable for transmission over the air. TV transmitters use modulation techniques to embed the audio and video signals onto a carrier frequency, and the resulting signal is then amplified and broadcast through antennas. In the context of digital television, modern TV transmitters often use advanced modulation schemes to transmit digital signals, providing improved picture and sound quality.
