Research Summary

Ultra Pure Water (UPW) for semiconductor manufacturing is water that has undergone a rigorous purification process to remove impurities and contaminants to an extremely high level. UPW is essential for semiconductor fabrication processes because even minute traces of impurities can negatively affect the performance and reliability of semiconductor devices. The purification process typically involves advanced techniques such as reverse osmosis, ion exchange, and filtration to achieve the desired level of purity, ensuring that the water used in semiconductor manufacturing is virtually free of dissolved solids, ions, organic compounds, bacteria, and particles. UPW is used in various critical stages of semiconductor production, including wafer cleaning, chemical etching, photoresist development, and final rinsing, where cleanliness and purity are paramount to achieving high-quality semiconductor devices.
