Research Summary

Ultrafiltration membrane filtration is a separation process that utilizes a semipermeable membrane with specific pore sizes to separate particles and solutes from a liquid. Ultrafiltration membranes have pore sizes in the range of 0.01 to 0.1 micrometers, allowing them to selectively retain particles such as colloids, proteins, and microorganisms while allowing smaller molecules like water and ions to pass through. This technology is widely used in water treatment, wastewater purification, and various industrial processes. By applying pressure, the liquid is forced through the membrane, separating contaminants from the desired components. Ultrafiltration is an effective method for removing suspended solids, bacteria, and macromolecules, contributing to the production of clean and purified water for various applications, including drinking water production and industrial processes requiring high-quality water.

The major global manufacturers of Ultrafiltration Membrane Filtration include Koch, Asahi Kasei, SUEZ, DuPont, Toray, 3M (Membrana), Mitsubishi Chemical, Nitto Denko Corporation, Synder Filtration, Microdyn-Nadir, Grant (Canpure), Pentair (X-Flow), Pall
