Research Summary

Ultrafine silica fume, also known as microsilica, is a byproduct of the production of silicon metal or ferrosilicon alloys in high-temperature electric arc furnaces. This material consists of extremely fine particles of amorphous silica, with sizes typically in the nanometer range. Ultrafine silica fume is characterized by its high surface area, pozzolanic reactivity, and ability to fill voids within concrete or other construction materials. It is commonly used as a supplementary cementitious material in concrete mixes, enhancing the strength and durability of the resulting structures. The small particle size and reactive nature of ultrafine silica fume contribute to improved concrete properties, including increased compressive strength, reduced permeability, and enhanced resistance to chemical attacks and corrosion. This material plays a vital role in modern construction practices, contributing to the development of high-performance and sustainable concrete structures.

The major global manufacturers of Ultrafine Silica Fume include Elkem (Blue Star), Globe Specialty Metals (Ferroglobe), FerroAtl?ntica (Ferroglobe), Finnfjord, RW Silicium
