Research Summary

An ultrasonic DNA shearer is a sophisticated laboratory instrument used in molecular biology and genetics research to fragment DNA molecules into smaller, more manageable pieces. This fragmentation process is essential for various applications, such as DNA sequencing, cloning, and genetic analysis. The ultrasonic DNA shearer employs ultrasonic waves to disrupt the DNA strands, creating random breaks in the double helix structure. These breaks result in DNA fragments of varying sizes, which can be precisely controlled by adjusting parameters such as sonication time and intensity. The advantage of using ultrasonic technology lies in its ability to generate uniform and reproducible DNA fragments without introducing chemical contaminants or altering the DNA sequence. Researchers can then utilize these fragmented DNA samples for downstream applications, including polymerase chain reaction (PCR), next-generation sequencing (NGS), and DNA fingerprinting, facilitating the study of genes, genomes, and genetic variation in diverse organisms.

The major global manufacturers of Ultrasonic DNA Shearer include Thermo Fisher

Scientific, Diagenode (Hologic), Hielscher, Covaris, Qsonica, TUOHE, NingBo Scientz Biotechnology, Shanghai Jingxin Industrial Development, etc. The global players competition landscape in this report is divided into three tiers.
