Research Summary

An ultrasonic tissue ablation system is a medical device designed for surgical procedures where the removal or destruction of tissue is required. This system utilizes ultrasonic energy to break down and remove targeted tissues with precision. It typically consists of a generator that produces ultrasonic vibrations and a handpiece with a vibrating probe. When the vibrating probe comes into contact with the tissue, the ultrasonic energy causes mechanical disruption and fragmentation, leading to tissue ablation or removal. Ultrasonic tissue ablation is often used in various surgical specialties, including general surgery, urology, and gynecology, for procedures such as tumor removal, kidney stone fragmentation, or endometrial ablation. The benefits of this technology include reduced bleeding, minimal thermal damage to surrounding tissues, and enhanced precision, contributing to improved surgical outcomes and patient recovery.

The major global manufacturers of Ultrasonic Tissue Ablation System include Chongqing Haifu, Haiying, Puluo Medical, InSightec Ltd, Shanghai A&S, etc. The global
