Research Summary

Ultrasound gel is a conductive medium used in medical imaging procedures, particularly during ultrasound examinations. This gel is applied to the skin to facilitate the transmission of ultrasound waves between the transducer and the body's tissues. Its primary function is to eliminate air pockets between the transducer and the skin, ensuring efficient and uninterrupted passage of sound waves. The gel is water-based and typically contains glycerin or a similar substance to create a viscous consistency that adheres well to the skin. Ultrasound gel is essential for enhancing the quality of ultrasound images by minimizing acoustic impedance and improving the coupling between the ultrasound probe and the patient's body. It is widely used in various medical settings, including obstetrics, cardiology, and diagnostic imaging, providing a smooth interface for the ultrasound transducer and optimizing the accuracy of the diagnostic information obtained.

The major global manufacturers of Ultrasound Gel include Sonotech, Parker Laboratories, ECO-MED, National Therapy Products, Ultragel Kft, Tele-Paper Malaysia,
