### Research Summary

An ultraviolet (UV) light source is a device that emits ultraviolet radiation, which is light with wavelengths shorter than visible light but longer than X-rays. UV light sources can vary in technology, including mercury vapor lamps, low-pressure mercury lamps, and light-emitting diodes (LEDs). These sources are employed in a range of applications, such as sterilization, water purification, fluorescence detection, and curing processes. In sterilization, UV light is utilized to kill or inactivate microorganisms by damaging their DNA. In water purification systems, UV light is used to disinfect water by deactivating harmful bacteria and viruses. In fluorescence detection, certain substances fluoresce when exposed to UV light, aiding in analytical and diagnostic processes. UV curing involves the use of UV light to initiate a chemical reaction that quickly hardens or dries coatings, inks, or adhesives in industrial processes. The versatility of UV light sources makes them valuable across diverse fields for applications requiring disinfection, detection, or curing.
