Research Summary

Underfill is a material used in electronics packaging to fill the gap between a semiconductor device, such as a microchip or integrated circuit, and the substrate, typically a printed circuit board (PCB). The purpose of underfill is to provide mechanical support and enhance the reliability of the electronic assembly by minimizing stresses caused by differences in thermal expansion between the device and the substrate. Underfill materials are typically liquid or gel-like before curing and are dispensed around the edges of the semiconductor device. During the curing process, the underfill material solidifies, creating a bond that helps protect the solder joints and prevents damage from factors such as thermal cycling or mechanical stress. This process is crucial in applications where electronic components may experience temperature variations and mechanical stresses during their operational life, such as in automotive electronics or mobile devices.

The major global manufacturers of Underfill include Henkel, WON CHEMICAL, NAMICS, SUNSTAR, Hitachi Chemical, Fuji, Shin-Etsu Chemical, Bondline, AIM Solder, Zymet, Panacol-Elosol, Master Bond, DOVER, Darbond, HIGHTITE, U-bond,

etc. The global players competition landscape in this report is divided into three tiers.
