Research Summary

An Uninterrupted Power Supply (UPS) is an electrical device designed to provide temporary power backup during electrical outages or disruptions. UPS systems typically consist of a battery or set of batteries that are charged when the main power supply is available. In the event of a power outage, the UPS immediately switches to battery power, preventing interruptions in electrical supply to connected devices. UPS systems are commonly used to safeguard critical electronic equipment, such as computers, servers, networking devices, and other sensitive electronics, from potential damage or data loss caused by sudden power failures or fluctuations. Additionally, UPS units often feature surge protection and voltage regulation capabilities, ensuring a stable and clean power supply to connected devices, even in areas with unstable electricity grids.
