### Research Summary

Untempered steel refers to steel that has not undergone the process of tempering after heat treatment. Cold forging is a metalworking process in which metal blanks are shaped or formed using compressive forces at room temperature or slightly above. Untempered steel is commonly used in cold forging processes due to its hardness and strength properties, which are retained after heat treatment such as quenching and annealing. The lack of tempering allows the steel to maintain its maximum hardness, making it suitable for applications requiring high strength and wear resistance, such as automotive components, fasteners, shafts, and tools. Untempered steel in cold forging operations undergoes deformation and shaping without the need for additional heating, which helps preserve the material's mechanical properties and dimensional accuracy. However, it is important to note that untempered steel may be more prone to brittleness and may require careful handling and processing techniques during cold forging to avoid cracking or failure.

The major global manufacturers of Untempered Steel for Cold Forging include Nippon Steel, KOBELCO, etc. The global players competition landscape in this report is divided into three tiers.
