Research Summary

A UV infection control device is a specialized tool or system that utilizes ultraviolet (UV) light to disinfect and control the spread of infections by inactivating or killing microorganisms, including bacteria and viruses. These devices typically emit UV-C light, which has germicidal properties, and are employed in various settings such as healthcare facilities, laboratories, and public spaces. UV infection control devices are designed to disinfect air, surfaces, and objects by targeting and disrupting the genetic material of microorganisms, preventing their ability to replicate. These devices offer an efficient and chemical-free method of sterilization, contributing to enhanced hygiene and reduced transmission of infections. UV infection control devices come in different forms, including UV air purifiers, UV disinfection lamps, and UV robots, each catering to specific applications and environments where maintaining a sterile environment is crucial.
