Research Summary

UV monomers are single-unit molecules that polymerize when exposed to ultraviolet (UV) light. These monomers contain reactive functional groups, such as double bonds or acrylate groups, which undergo photopolymerization when activated by UV radiation. During this process, the double bonds or acrylate groups react with each other, forming covalent bonds and linking the monomers together to create long polymer chains. UV monomers are widely used in UV-curable materials, including coatings, inks, adhesives, and dental composites. They offer several advantages, such as rapid curing, excellent adhesion, and the ability to produce coatings and products with high performance properties like scratch resistance and chemical resistance. Additionally, UV monomers enable precise control over the curing process, allowing for tailored formulations to meet specific application requirements.

The major global manufacturers of UV Monomer include BASF, DSM Coating Resins, Arkema Group, Allnex Group, IGM Resins, Lambson Limited, Nagase ChemteX Corporation, Evonik Industries, Osaka Organic Chemical, Tianjin Jiuri New Materials,
