By 2025, China's market size is expected to be Million USD, representing approximately % of the global market share.

Research Summary

UV photoinitiators are chemical compounds used in UV curing processes to initiate and facilitate the polymerization or crosslinking of photopolymerizable materials. When exposed to ultraviolet (UV) light, these compounds undergo a photochemical reaction, generating reactive species such as free radicals or cations. These reactive species then initiate the curing of UV-sensitive materials, such as inks, adhesives, and coatings, by causing the monomers to polymerize and form a solid, cured material. UV photoinitiators play a crucial role in UV curing technology, enabling rapid and controlled curing processes in applications like printing, coatings, and 3D printing. The selection of appropriate UV photoinitiators depends on factors such as the desired curing speed, wavelength compatibility with the UV light source, and the specific characteristics required for the cured material.

The major global manufacturers of UV Photoinitiators include IGM Resins, Tianjin Jiuri New Materials, Tronly, Hubei Gurun, DBC, Zhejiang Yangfan New Materials, Jinkangtai Chemical, Arkema, NewSun, Eutec, Polynaisse, Kurogane Kasei, etc. The global
