Research Summary

Vacuum-assisted biopsy devices are medical instruments used in the diagnosis of breast abnormalities and lesions. Typically employed in breast imaging procedures, these devices utilize a vacuum-assisted system to extract tissue samples for pathological examination. During the procedure, a thin, hollow needle is inserted into the suspicious area of the breast, and the vacuum-assisted system helps draw in multiple tissue samples through the needle in a controlled and efficient manner. This technique allows for a more comprehensive sampling of tissue compared to traditional biopsy methods, increasing the accuracy of diagnosis. Vacuum-assisted biopsy devices are commonly used for both diagnostic and minimally invasive procedures, offering patients a less invasive alternative to surgical biopsy while providing healthcare professionals with valuable information for the detection and characterization of breast abnormalities.

The major global manufacturers of Vacuum-assisted Biopsy Devices include BD, Mammotome, Hologic, etc. The global players competition landscape in this report is
