### Research Summary

Vacuum Inert Gas Atomization (VIGA) processing technology is a method used in the production of metal powders, particularly for advanced materials and applications in industries such as aerospace, automotive, and medical devices. In VIGA, a high-pressure inert gas, such as argon, is introduced into a vacuum chamber along with molten metal. The molten metal is then atomized into fine droplets using a nozzle or rotating disk, and the inert gas rapidly solidifies these droplets into metal powders as they travel through the chamber. This process results in spherical-shaped metal powders with controlled particle sizes and high purity. VIGA technology offers several advantages over traditional powder production methods, including improved particle morphology, reduced contamination, and better control over composition and microstructure. These metal powders produced through VIGA are often used in additive manufacturing (3D printing), powder metallurgy, and surface coating applications, where precise material properties and performance are critical.

The major global suppliers of Vacuum Inert Gas Atomization (VIGA) Processing Technology include ALD Vacuum Technologies, Hogan, EasyFashion Industry, EIGA (Electrode Induction Melting Inert Gas Atomization), Tekna, Praxair, Heraeus, Consarc, Oerlikon, Satrindtech, SMS Group, VDM Metals, etc. The global players competition landscape in this report is divided into three tiers.
