Research Summary

A vascular snare is a medical device used in interventional cardiology and vascular procedures to capture and retrieve foreign objects or materials within the vascular system. It typically consists of a looped wire or similar structure that can be opened and closed using a control mechanism. The vascular snare is introduced through a catheter, guided to the target area using fluoroscopy or other imaging techniques, and then deployed to encircle the object to be retrieved, such as a misplaced stent or embolic material. Once the snare is securely positioned around the target, it can be tightened to grasp and retrieve the material, allowing for its safe removal from the blood vessels. Vascular snares play a crucial role in ensuring the success of endovascular procedures and mitigating potential complications by providing a means to retrieve objects inadvertently released or lodged in the vascular system during medical interventions.
