Research Summary

Vehicle-to-Grid (V2G) is an innovative technology that enables bidirectional energy flow between electric vehicles (EVs) and the power grid. In this system, electric vehicles, when connected to the grid, can not only draw electrical power for charging but also feed excess energy back into the grid when they are not in use. V2G technology allows EVs to act as mobile energy storage units, helping to balance the demand and supply of electricity. During peak demand periods, electric vehicles can release stored energy to the grid, supporting the grid's stability. Conversely, when the grid has surplus energy or during low-demand periods, EVs can charge their batteries. V2G technology holds the potential to enhance grid resilience, increase renewable energy integration, and provide additional revenue streams for EV owners by participating in energy markets.

The major global suppliers of Vehicle-to-Grid (V2G) include NUVVE, Enel Energia, Moixa, E.ON, The Mobility House, Tennet, Fermata Energy, KEPCO, EDF Energy, Tokyo Electric Power, ActewAGL, etc. The global players competition landscape in this report is divided into three tiers.
