Research Summary

A vein finder is a medical device designed to assist healthcare professionals in locating veins beneath a patient's skin. It uses various technologies, such as infrared light, near-infrared light, or ultrasound, to visualize the vasculature and display a real-time image of veins on the surface of the skin. This technology aids in identifying suitable veins for procedures like venipuncture or intravenous (IV) catheter insertion. By offering a non-invasive and real-time solution, vein finders enhance the accuracy and efficiency of medical procedures, particularly in patients with challenging venous access, such as infants, elderly individuals, or those with difficult-to-see veins. The device is especially beneficial for reducing discomfort and improving success rates in needle insertion procedures.
