Research Summary

Vermicompost is a nutrient-rich organic fertilizer produced through the process of composting with the aid of earthworms. This sustainable and natural method involves feeding organic waste materials, such as kitchen scraps and plant residues, to specific species of earthworms, typically *Eisenia fetida*. As the earthworms consume and digest the organic matter, they excrete nutrient-dense castings, also known as vermicast. Vermicompost is prized for its ability to enhance soil fertility, improve soil structure, and provide essential nutrients like nitrogen, phosphorus, and potassium for plant growth.
