Research Summary

Virtual commissioning is a process used in engineering and manufacturing industries to simulate and validate the functionality of automated systems, production lines, or machinery in a virtual environment before physical implementation. It involves creating digital models of the manufacturing equipment and integrating them into a virtual simulation environment. Through virtual commissioning, engineers can test and optimize the performance of the equipment, identify potential issues, and validate control systems and automation programs without the need for physical prototypes or disrupting production operations. This approach allows for early detection and resolution of design flaws, reduces project lead times, and minimizes costs associated with system downtime and rework. Virtual commissioning can also facilitate training for operators and maintenance personnel, improving overall system performance and efficiency. Overall, virtual commissioning plays a crucial role in ensuring the successful implementation and operation of complex automated systems in various industries.
