Research Summary

Virtual machines (VMs) are software-based representations of physical computers that run operating systems and applications. They are created using virtualization software, which allows multiple VMs to run on a single physical machine or server. Each VM operates independently of the others, with its own virtual hardware resources, including CPU, memory, storage, and network interfaces. Virtual machines enable organizations to maximize the use of their hardware resources by consolidating multiple workloads onto fewer physical servers. They also provide flexibility, scalability, and cost savings, as VMs can be easily created, cloned, and moved between physical servers without requiring additional hardware. Virtual machines are commonly used for server consolidation, software development and testing, sandboxing environments, application deployment, disaster recovery, and cloud computing. They offer a cost-effective and efficient solution for running multiple operating systems and applications on a single physical infrastructure.

The major global suppliers of Virtual Machines include VMware, IBM, Huawei, Hewlett

Packard Enterprise, Oracle, Citrix, Microsoft, H3C, Red Hat, Inspur, Easted, Winhong, etc. The global players competition landscape in this report is divided into three tiers.
