Research Summary

Vitamin A is commonly used as a feed additive in animal nutrition to ensure proper growth, development, and overall health of livestock, poultry, and aquaculture species. In animal feed, vitamin A is typically added in the form of preformed vitamin A (retinyl acetate or retinyl palmitate) or as a source of provitamin A carotenoids, such as beta-carotene. Vitamin A plays a crucial role in various physiological processes in animals, including vision, immune function, reproduction, and skin and mucous membrane health. It is particularly important for animals raised indoors or in environments with limited access to natural sunlight, as vitamin A is synthesized in the body from carotenoids with the help of sunlight. Deficiency of vitamin A in animals can lead to a range of health problems, including impaired vision, reduced immune function, reproductive disorders, and poor growth and development. Therefore, adding vitamin A to animal feed helps ensure that animals receive adequate levels of this essential nutrient to support their overall health and productivity. The inclusion level of vitamin A in animal feed is carefully regulated and formulated based on the specific nutrient requirements of different species and production stages, as well as considerations such

as dietary composition and environmental factors.
