### Research Summary

Vitamin premixes are formulations containing a combination of essential vitamins that are added to animal feed, pet food, and sometimes human food products to ensure that the diet provides adequate levels of these essential nutrients. These premixes are typically composed of various vitamins, such as vitamin A, vitamin D, vitamin E, vitamin K, and the B-complex vitamins (including thiamine, riboflavin, niacin, pantothenic acid, pyridoxine, biotin, folic acid, and cobalamin). The composition and dosage of the vitamins in premixes are carefully balanced to meet the specific nutritional needs of the target species or consumer demographic. Vitamin premixes are commonly used in commercial animal feed manufacturing to optimize animal health, growth, and productivity, as well as in pet food formulations to support the nutritional requirements of companion animals. They may also be used in food fortification programs to address nutrient deficiencies in human populations, particularly in regions where access to diverse and nutrient-rich foods is limited. Overall, vitamin premixes play a vital role in ensuring adequate vitamin intake and promoting overall health and well-being in both animals and humans.
