Research Summary

Voluntary carbon offsets for forestry involve projects aimed at mitigating climate change by preserving, restoring, or sustainably managing forests to absorb and store carbon dioxide from the atmosphere. These projects typically involve activities such as reforestation, afforestation (planting trees on previously non-forested land), forest conservation, and improved forest management practices. Through photosynthesis, trees and forests naturally capture carbon dioxide from the air and store it in their biomass and soil, helping to offset greenhouse gas emissions. By investing in voluntary carbon offsets for forestry projects, individuals, businesses, and organizations can support the protection and restoration of forests while offsetting their own carbon emissions. These projects not only contribute to carbon sequestration but also provide additional environmental, social, and economic benefits such as biodiversity conservation, watershed protection, and sustainable livelihoods for local communities.
