Research Summary

Wafer transport boxes are specialized containers used in semiconductor manufacturing to safely transport and store semiconductor wafers during various stages of the fabrication process. These boxes are designed to provide a controlled environment that protects the wafers from contamination, mechanical damage, and electrostatic discharge (ESD) during handling, storage, and transportation. Wafer transport boxes are typically made of materials such as plastic or metal and are designed to accommodate multiple wafers in a stack. They often feature cushioning materials, such as foam inserts, to securely hold the wafers in place and minimize the risk of damage during transit. Additionally, wafer transport boxes may incorporate anti-static properties to prevent electrostatic discharge, which can damage sensitive semiconductor devices. These boxes play a critical role in ensuring the integrity and quality of semiconductor wafers throughout the supply chain, from fabrication facilities to assembly and packaging facilities, and ultimately to end customers.

The major global manufacturers of Wafer Transport Boxes include Entegris, Shin-Etsu
