### Research Summary

Water-cooled chillers are refrigeration systems used to cool water for various industrial, commercial, or residential applications. These chillers work by transferring heat from water to a refrigerant gas through a process of compression and condensation. Unlike air-cooled chillers, which dissipate heat into the ambient air, water-cooled chillers use water as a cooling medium to remove heat from the refrigerant. The chilled water produced by these systems can then be circulated through pipes to cool equipment, processes, or indoor spaces. Water-cooled chillers are commonly used in large-scale air conditioning systems for commercial buildings, data centers, and industrial facilities, as well as in process cooling applications such as food processing, pharmaceutical manufacturing, and chemical processing. They offer advantages such as higher efficiency, quieter operation, and greater flexibility in installation compared to air-cooled chillers. However, water-cooled chillers require access to a reliable water source for cooling, such as a cooling tower or condenser water loop, and may incur higher installation and operating costs. Overall, water-cooled chillers are an effective solution for cooling large buildings and industrial processes where precise temperature control

and energy efficiency are paramount.

The major global manufacturers of Water Cooled Chillers include Johnson Controls-Hitachi, Trane (Ingersoll-Rand), Mitsubishi, Carrier, Daikin, LG Electronics, TICA, DunAn, Dunham-Bush, Bosch, Lennox, Parker Hannifin, Smardt Chiller Group, Tsing Hua Tongfang, Kingair, etc. The global players competition landscape in this report is divided into three tiers.
